**Exp-7: Write a program to implement Logistic Regression (LR) algorithm in python**

```
# Import required libraries

from sklearn.datasets import load_iris
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import confusion_matrix, accuracy_score

# Load the Iris dataset

iris = load_iris()

X = iris.data    # Features
y = iris.target  # Target labels

# Split the dataset into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.2, random_state=42
)

# Create the Logistic Regression model
model = LogisticRegression(max_iter=200)

# Train the model
model.fit(X_train, y_train)

# Predict the test data
y_pred = model.predict(X_test)

# Display Actual and Predicted values
print("Actual Labels :", y_test)
print("Predicted Labels:", y_pred)

# Generate Confusion Matrix
cm = confusion_matrix(y_test, y_pred)

print("\nConfusion Matrix:")
print(cm)
```

```
# Calculate Accuracy

accuracy = accuracy_score(y_test, y_pred)

print("\nAccuracy: {:.2f}%".format(accuracy * 100))
```

**Output:**

```
... Actual Labels : [1 0 2 1 1 0 1 2 1 1 2 0 0 0 0 1 2 1 1 2 0 2 0 2 2 2 2 2 0 0]
Predicted Labels: [1 0 2 1 1 0 1 2 1 1 2 0 0 0 0 1 2 1 1 2 0 2 0 2 2 2 2 2 0 0]

Confusion Matrix:
[[10  0  0]
 [ 0  9  0]
 [ 0  0 11]]

Accuracy: 100.00%
```
